

Core Cell Panels

Core Cell Panels are vertical void filler panels that fill voids between, and on the sides of loads. These void fillers can be used to prevent the side-to-side shifting and take up space from front to back inside shipping containers. Many thicknesses and sizes are available and cells can be manufactured in different sizes to allow for different strength requirements. Meets AAR specifications.

Benefits include recycle ability for the receiving company, lower cost alternative compared to other void fillers, lightweight compared to wood, easy to handle.

Intermodal

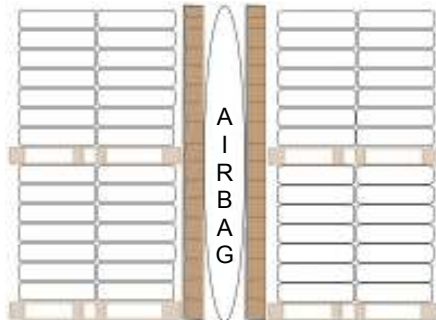

Export/Container

Over the road

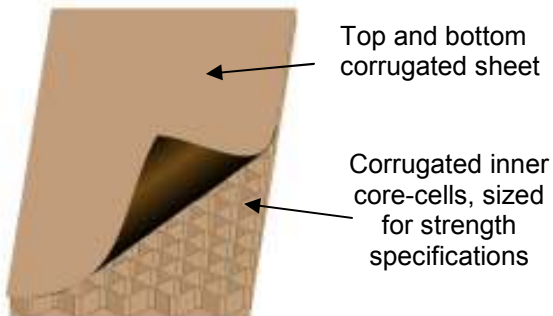

Boxcar Rail

Void filler – use with an airbag

Void filler – use between panel units

Core Cell Panel

Use this panel to take up additional voids in containers.

Both lateral and lengthwise voids can be filled utilizing different strength panels.

Many custom size combinations are available
